One-Pager: Apply Kit — cvdrops.com

Author: Ahmet Berk Conker (Founder & PM) · **Product:** cvdrops.com, AI-powered CV builder (TR / EN / DE) · **Status:** Shipped

1. Problem

Turkish-speaking candidates applying for jobs in Germany and internationally usually send one generic CV to every posting. Tailoring a CV and cover letter to each job is slow, so most candidates skip it. The result is weak keyword match in ATS screening and low response rates.

Evidence that shaped the problem

- Candidates already had a CV but didn't know how to adapt it to a specific posting.
- Tailoring is repeated for every application, so the cost adds up across dozens of applications.
- Language is an extra barrier: the CV may be in Turkish while the posting is in German or English.

2. Target user

- **Primary:** Turkish-speaking job seekers applying to roles in Germany or internationally.
- **Secondary:** New graduates reached through university career offices.

3. Goal

Turn "tailor my application to this job" from an hour of manual work into a guided flow of a few minutes, and make it the main paid action in cvdrops.

4. Solution: Apply Kit

The user pastes a job posting, and Apply Kit generates a **tailored CV and cover letter** based on the user's existing cvdrops CV.

User flow

1. The user finishes their base CV in the 13-step guided wizard.
2. The user opens Apply Kit and pastes the job posting text.
3. The Claude API analyses the posting (requirements, keywords, seniority) against the CV.
4. Output: a tailored CV version and a matching cover letter in the selected language (TR / EN / DE).
5. The user reviews and edits, then exports.

Funnel around it

- **Free ATS score (no sign-up)** is the acquisition hook. It shows the gap between the CV and ATS expectations and leads naturally into Apply Kit.
- Apply Kit is the core paid action.

5. Requirements

#	Requirement	Priority
R1	User can paste a free-text job posting (any of TR / EN / DE)	Must
R2	Output keeps the user's real experience; AI may rephrase and reorder but must not invent jobs, dates or achievements	Must
R3	Tailored CV and cover letter are generated in the selected output language	Must
R4	User can edit the output before export	Must
R5	Each Apply Kit run consumes credits; the user sees the cost before running	Must
R6	Output stays ATS-friendly (simple structure, no tables or graphics in the CV body)	Must
R7	Generated versions are saved per job so the user can return to them	Should

Acceptance criteria (examples)

- If the posting is empty or too short, the user gets a clear error and no credits are consumed.
- If generation fails, no credits are consumed and the user can retry.
- The output contains no employer, title or date that isn't in the base CV.

6. Pricing decision

One-time credit packs instead of a subscription. Job searching is episodic: users are intensive for a few weeks, then stop. A subscription would create churn and refund friction. Pay-per-action matches value to usage, and the free ATS score keeps the entry barrier at zero.

7. Success metrics

- **Activation:** % of ATS-score users who create an account and complete a base CV.
- **Conversion:** % of base-CV users who buy a credit pack.
- **Core usage:** Apply Kit runs per paying user.
- **Quality guardrail:** edit rate on generated output and user-reported "invented content" issues (target: zero hallucinated experience).
- **Acquisition:** traffic and sign-ups from SEO and university career-office channels.

8. Risks & mitigations

Risk	Mitigation
AI invents experience	Strict prompt rules + R2 acceptance check + mandatory user review before export
API cost per run is too high	Credit pricing set above per-run model cost; failed runs don't consume credits
Low trust in an unknown brand	Free ATS score with no sign-up to prove value first

9. Tech & launch

- **Stack:** Next.js, Supabase, Claude API, Vercel.
- **Measurement:** GA4, Microsoft Clarity, Search Console.
- **Go-to-market:** SEO + university career-office outreach.
- Built and launched end to end with AI-assisted development (Claude Code).
